Description

Technical Field

[0001] This invention relates to heteroaryl-phenyl pyrazole derivatives and methods of treatment and pharmaceutical compositions for the treatment of cyclooxygenase mediated diseases. The compounds of this invention inhibit the biosynthesis of prostaglandins by intervention of the action of the enzyme cyclooxygenase on arachidonic acid, and are therefore useful in the treatment or alleviation of inflammation and other inflammation associated disorders, such as arthritis, neurodegeneration and colon cancer, in mammals, preferably humans, dogs, cats or livestock.

[0002] Nonsteroidal anti-inflammatory drugs (NSAIDs) are widely used in treating pain and the signs and symptoms of arthritis because of their analgesic and anti-inflammatory activity. It is accepted that common NSAIDs work by blocking the activity of cyclooxygenase (COX), also known as prostaglandin G/H synthase (PGHS), the enzyme that converts arachidonic acid into prostanoids. Prostaglandins, especially prostaglandin E₂ (PGE₂), which is the predominant eicosanoid detected in inflammation conditions, are mediators of pain, fever and other symptoms associated with inflammation. Inhibition of the biosynthesis of prostaglandins has been a therapeutic target of anti-inflammatory drug discovery. The therapeutic use of conventional NSAIDs is, however, limited due to drug associated side effects, including life threatening ulceration and renal toxicity. An alternative to NSAIDs is the use of corticosteroids, however, long term therapy can also result in severe side effects.

[0003] The use of NSAIDs in the treatment or alleviation of inflammation and other inflammation associated disorders in dogs and cats has been more limited than that in humans: *e.g.*, only three such NSAIDs have been approved by the Food and Drug Administration, Committee on Veterinary Medicine (FDA/CVM), for use in dogs in the United States, *i.e.*, ETOGESIC® (etodolac), ARQUEL® (meclofenamic acid) and RIMADYL® (carprofen). Consequently, there is less experience and knowledge in veterinary medicine about safety and efficacy issues surrounding the use of NSAIDs in dogs. In veterinary medicine, for example, the most common indication for NSAIDs is the treatment of degenerative joint disease (DJD), which in dogs often results from a variety of developmental diseases, *e.g.*, hip dysplasia and osteochondrosis, as well as from traumatic injuries to joints. In addition to the treatment of chronic pain and inflammation, NSAIDs are also useful in dogs for treating post-surgical acute pain, as well as for treating clinical signs associated with osteoarthritis.

[0004] Two forms of COX are now known, a constitutive isoform (COX-1) and an inducible isoform (COX-2) of which expression is upregulated at sites of inflammation (Vane, J. R.; Mitchell, J. A.; Appleton, I.; Tomlinson, A.; Bishop-Bailey, D.; Croxtoll, J.; Willoughby, D. A. *Proc. Natl. Acad. Sci. USA*, 1994, 91, 2046). COX-1 is thought to play a physiological role and to be responsible for gastrointestinal and renal protection. On the other hand, COX-2 appears to play a pathological role and is believed to be the predominant isoform present in inflammation conditions. A pathological role for prostaglandins has been implicated in a number of human disease states including rheumatoid arthritis and osteoarthritis, pyrexia, asthma, bone resorption, cardiovascular diseases, dysmenorrhea, premature labour, nephritis, nephrosis, atherosclerosis, hypotension, shock, pain, cancer, and Alzheimer disease. It is believed that compounds that would selectively inhibit the biosynthesis of prostaglandins by intervention of activity of the enzyme COX-2 on arachidonic acid would provide alternate therapy to the use of conventional NSAIDs or corticosteroids in that such compounds would exert anti-inflammatory effects without the adverse side effects associated with COX-1 inhibition.

[0005] A variety of sulfonylbenzene compounds which inhibit COX have been disclosed in patent publications (WO 97/16435, WO 97/14691, WO 96/19469, WO 96/36623, WO 96/03392, WO 96/03387, WO 97/727181, WO 96/936617, WO 96/19469, WO 96/08482, WO 95/00501, WO 95/15315, WO 95/15316, WO 95/15317, WO 95/15318, WO 97/13755, EP 0799523, EP 418845, and EP 554829). Especially, International Publication Number WO 97/11704 discloses pyrazole compounds substituted with optionally substituted aryl.

[0007] The present invention also relates to the pharmaceutically acceptable acid addition salts of compounds of the formula I. The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the aforementioned base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as the hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate, bisulfate, phosphate, acid phosphate, acetate, lactate, citrate, acid citrate, tartrate, bitartrate, succinate, maleate, fumarate, glu-

conate, saccharate, benzoate, methanesulfonate, benzenesulfonate, p-toluenesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)] salts.

[0008] The invention also relates to base addition salts of formula I. The chemical bases that may be used as reagents to prepare pharmaceutically acceptable base salts of those compounds of formula I that are acidic in nature are those that form non-toxic base salts with such compounds. Such non-toxic base salts include, but are not limited to those derived from such pharmacologically acceptable cations such as alkali metal cations (e.g., potassium and sodium) and alkaline earth metal cations (e.g., calcium and magnesium), ammonium or watersoluble amine addition salts such as N-methylglucamine-(meglumine), and the lower alkanolammonium and other base salts of pharmaceutically acceptable organic amines.

[0009] The compounds of the invention may also exist in different tautomeric forms. This invention relates to all tautomers of formula I.

[0010] Certain compounds of the invention described herein contain one or more asymmetric centers and are capable of existing in various stereoisomeric forms. The present invention contemplates all such possible stereoisomers as well as their racemic and resolved, enantiomerically pure forms.

[0011] The term "treating", as used herein, refers to reversing, alleviating, inhibiting the progress of, or preventing the disorder or condition to which such term applies, or one or more symptoms of such disorder or condition. The term "treatment", as used herein, refers to the act of treating, as "treating" is defined immediately above.

[0012] The term "livestock animals" as used herein refers to domesticated quadrupeds, which includes those being raised for meat and various byproducts, e.g., a bovine animal including cattle and other members of the genus *Bos*, a porcine animal including domestic swine and other members of the genus *Sus*, an ovine animal including sheep and other members of the genus *Ovis*, domestic goats and other members of the genus *Capra*; domesticated quadrupeds being raised for specialized tasks such as use as a beast of burden, e.g., an equine animal including domestic horses and other members of the family Equidae, genus *Equus*, or for searching and sentinel duty, e.g., a canine animal including domestic dogs and other members of the genus *Canis*; and domesticated quadrupeds being raised primarily for recreational purposes, e.g., members of *Equus* and *Canis*, as well as a feline animal including domestic cats and other members of the family Felidae, genus *Felis*.

[0013] "Companion animals" as used herein refers to cats and dogs. As used herein, the term "dog(s)" denotes any member of the species *Canis familiaris*, of which there are a large number of different breeds. While laboratory determinations of biological activity may have been carried out using a particular breed, it is contemplated that the inhibitory compounds of the present invention will be found to be useful for treating pain and inflammation in any of these numerous breeds. Dogs represent a particularly preferred class of patients in that they are well known as being very susceptible to chronic inflammatory processes such as osteoarthritis and degenerative joint disease, which in dogs often results from a variety of developmental diseases, e.g., hip dysplasia and osteochondrosis, as well as from traumatic injuries to joints. Conventional NSAIDs, if used in canine therapy, have the potential for serious adverse gastrointestinal reactions and other adverse reactions including kidney and liver toxicity. Gastrointestinal effects such as single or multiple ulcerations, including perforation and hemorrhage of the esophagus, stomach, duodenum or small and large intestine, are usually debilitating, but can often be severe or even fatal.

[0014] The subject invention also includes isotopically-labelled compounds, which are identical to those recited in Formula I, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl , respectively. Compounds of the present invention, prodrugs thereof, and pharmaceutically acceptable salts of said compounds or of said prodrugs which contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as ^3H and ^{14}C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e., ^3H , and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e., ^2H , can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically labelled compounds of Formula I of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the Schemes and/or in the Examples and Preparations below, by substituting a readily available isotopically labelled reagent for a non-isotopically labelled reagent.

[0015] This invention also encompasses pharmaceutical compositions containing prodrugs of compounds of the formula I. This invention also encompasses methods of treating or preventing disorders that can be treated or prevented by the inhibition of matrix metalloproteinases or the inhibition of mammalian repressors comprising administering prodrugs of compounds of the formula I. Compounds of formula I having free amino, amido, hydroxy, hydroxamic acid, sulfonamid or carboxylic groups can be converted into prodrugs. Prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e.g., two, three or four) amino acid residues which are covalently joined

through peptide bonds to free amino, hydroxy or carboxylic acid groups of compounds of formula I. General Synthesis

[0075] Compounds of general formula (I) may be prepared by a variety of synthetic routes. Representative preparation procedures are outlined below. Unless otherwise indicated, A, R¹, R², R³, R⁴, X¹, X², X³ and X⁴ are as defined herein above.

[0076] In a desired reaction step of the processes described hereafter, NH or hydroxy protections and removals of the protecting groups used may be carried out according to known procedures such as those described in Protective

Groups in Organic Synthesis edited by T. W. Green *et al.* (John Wiley & Sons, 1991). Isolated hydroxy groups can generally be protected as ethers including t-butyldimethylsilyl ethers, acetals and esters. In general, benzyl-type protecting groups are removed by hydrogenolysis, silyl esters by reaction with fluoride ions or under slightly acidic conditions and several 2-substituted thyl ethers can be cleaved by beta-elimination reactions.

[0077] Scheme 1 illustrates preparation methods of compounds of formula I through pyrazole ring formation.

SCHEME 1

ROUTE 1

ROUTE 2

Route 1 (Acylation and Pyrazole-ring Formation):

[0078] Referring to Route 1, a compound of the formula I may be prepared by reacting a diketone compound of formula 1-3 with a hydrazine compound of the formula 1-4 in a reaction inert solvent. Suitable solvents used in this reaction include alcohols such as ethanol, trifluoroethanol, methanol, propanol, isopropanol and butanol; dimethyl sulfoxide (DMSO); N,N-dimethylformamide (DMF); acetic acid; N,N-dimethylacetamide (DMA) and N-methyl-2-pyrrolidone (NMP). Preferred solvents used in this reaction are methanol, ethanol and acetic acid. This reaction may be conducted in the presence of a stoichiometric or catalytic amount of acid such as hydrochloric acid, acetic acid, trifluoroacetic acid, p-toluenesulfonic acid or sulfuric acid, preferably acetic acid. Alternatively, a compound of formula 1-4 may be subjected to the reaction as an acid addition salt such as hydrochloride. This reaction is generally carried out at a temperature from about 0°C to about 140°C, preferably at about the reflux temperature of the solvent for from about 2 to about 20 hours.

[0079] A compound of formula 1-3 is prepared from a compound of formula 1-1 by reaction with a compound of the formula 1-2 wherein L is a suitable leaving group in the presence of a suitable base and a reaction inert solvent. Compounds of formula 1-2 may be subjected to the reaction as esters; or ester equivalents such as acylimidazole; dialkylamide; halides; thioesters or acid anhydride. A compound of formula 1-2 is preferably used in this reaction as an acylimidazole or ester. Suitable bases used in this reaction include n-butyl lithium, potassium carbonate (K_2CO_3), sodium carbonate (Na_2CO_3), cesium carbonate (Cs_2CO_3), sodium hydride (NaH), sodium methoxide, potassium-*tert*-butoxide, lithium diisopropylamide (LDA), pyrrolidine, piperidine, lithium 1,1,1,3,3,3-hexamethyldisilazane ($(Me_3Si)_2NLi$) and the like. A preferred base is sodium methoxide. This reaction can be carried out in a solvent such as a di-(alkyl)ether (preferred is methyl *tert*-butyl ether), tetrahydrofuran (THF), dimethoxyethane (DME), 1,4-dioxane, methanol, dichloromethane, dimethylformamide (DMF), dimethylacetamide (DMA), or DMSO. Reaction temperature ranges from about -100° to about 150°C preferably from about 0°C to about 50°C, more preferably at about room temperature (i.e., from about 20°C to about 25°C) for from about 0.5 to 20 hours.

Route 2 (R^1 -moiety Introduction and Pyrazole-ring Formation):

[0080] As illustrated in Route 2, a compound of formula I may also be prepared by (1) a cross-coupling-reaction of a compound of formula 1-5, wherein L' is a suitable leaving group, with a compound of formula 1-6 followed by (2) pyrazole ring formation with a hydrazine compound of formula 1-4 as described herein above. In the cross-coupling reaction, a compound of formula 1-5 may be coupled with compounds of formula 1-6 under reaction conditions known to those skilled in the art. Typical compounds of formula 1-6 used in this reaction include boronic acid (so called Suzuki reaction), zinc halide (so called Negishi reaction), and tin (IV) derivatives (so called Stille reaction) and the like (for examples refer to Tetrahedron, Vol. 54, pp. 263-303, 1998; S. P. Stanforth). A suitable leaving group L' includes halogen, such as chloro, bromo or iodo, preferably iodo, or trifluorosulfonyloxy ($CF_3SO_3^-$).

[0081] When a compound of formula 1-6 is a boronic acid derivative the reaction is typically run in the presence of a suitable base and a palladium catalyst. A suitable base includes, but is not limited to, potassium hydroxide, thallium hydroxide, sodium or potassium bicarbonate, or an alkyl amine such as, but not limited to, triethylamine. Palladium catalysts typically employed include, for example, tetrakis(triphenylphosphine)palladium and dichlorobis(triphenylphosphine)palladium. Suitable solvents used in this reaction include, but is not limited to, benzene, toluene, dimethoxyethane (DME), 1,4-dioxane and dimethylformamide (DMF), preferably DME. Alternatively, the reaction may be conducted in biphasic media, for example, DME/water or 1,4-dioxane/water, preferably DME/water. The reaction is usually carried out at reflux temperature of solvent, however, lower or higher temperatures may be employed. Reaction time is typically for from 10 minutes to several days, usually for from 30 minutes to 15 hours.

[0082] When a compound of formula 1-6 is a zinc halide derivative the reaction is typically run in a suitable reaction inert solvent in the presence of a palladium or nickel catalyst. Suitable catalysts include, for example, tetrakis(triphenylphosphine)palladium, tetrakis(triphenylphosphine)nickel, dichlorobis(triphenylphosphine)palladium; dichlorobis(1,1-bis(diphenylphosphino)ferrocene)palladium, or dichlorobis(1,4-bis(diphenylphosphino)butane)palladium. Suitable solvents used in this reaction include, but is not limited to, tetrahydrofuran (THF), diethylether and dimethoxyethane (DME), preferably THF. The reaction is usually carried out at reflux temperature of solvent, however, lower or higher temperatures may be employed. Reaction time is typically for from about 10 minutes to several days, usually for from about 30 minutes to 15 hours.

[0083] When a compound of formula 1-6 is a tin (IV) derivative, for example, Me_3Sn-R^1 or Bu_3Sn-R^1 , the reaction is typically run in a suitable reaction inert solvent in the presence a palladium catalyst. Palladium catalysts typically employed include, for example, tetrakis(triphenylphosphine)palladium and dichlorobis(triphenylphosphine)palladium. If necessary, a co-catalyst such as lithium chloride, ammonium hydroxide or copper(I) bromide may be used. Suitable solvents used in this reaction include, but is not limited to, benzene, toluene, dimethoxyethane (DME), 1,4-dioxane, tetrahydrofuran (THF) and dimethylformamide (DMF), preferably DME or 1,4-dioxane. The reaction is usually carried

out at a reflux temperature of solvent, however, lower or higher temperatures may be employed. Reaction time is typically for from 10 minutes to several days, usually for from 30 minutes to 15 hours.

[0084] Alternatively, compounds of formula 1-3 may also be prepared by heteroaryl-ring formation on a corresponding acyl phenol, acyl halobenzene or N-formylmethylbenzamide compounds and acylation at para-position on the phenyl ring. The ring formations include (a) thiazole ring formation; (b) oxazole ring formation; (c) triazole ring formation; and (d) imidazole ring formation.

(a) Thiazole ring formation:

The thiazole ring formation can typically be carried out by first introducing a leaving group such as halo into the acyl moiety then reacting the compound thus obtained with either phosphorus pentasulfide in the presence of formamide, or thioacetamide. These reactions can be carried out in a reaction inert solvent such as dioxane under reflux.

(b) Oxazole ring formation:

The oxazole ring formation can typically be carried out by treating a 2-halo-1-phenyl-butanone compound in the presence of ammonium formate in formic acid under reflux. The oxazole ring formation may also be carried out treating an N-formylmethylbenzamide compound in the presence of triphenylphosphine, iodine and triethylamine.

(c) Triazole ring formation:

Compounds of formula 1-1 wherein R¹ is triazolyl may be prepared by reacting a cyano benzene compound with trimethylsilyldiazomethane in the presence of n-butyl lithium in a mixture of hexane and diethyl ether at about 0°C.

(d) Imidazole ring formation:

Compounds of formula I wherein R¹ is imidazolyl may be prepared by reacting a known halomethyl-carbonyl-benzene compound (e.g., those compounds described in *Justus Liebigs Ann. Chem.*, 1941, 546, 277 by Herbert) with formamide in water at about 140°C.

[0085] The latter acylation may be carried out by methods known to those skilled in the art or methods illustrated in Route 1 of Scheme 1.

[0086] Starting materials used in the processes in Scheme 1 are known compounds or readily prepared by methods known to those skilled in the art (e.g., *Collection Czechoslov. Chem. Commun.* Vol. 37, p. 1721, 1972 by J. Vavrina *et al.*).

[0087] Scheme 2 illustrates an alternate method for preparing compounds of formula I.

SCHEME 2

Thus, a compound of formula I may also be prepared by a cross-coupling reaction of a compound of formula 2-1, wherein L' is a suitable leaving group, with a compound of formula 1-6. In the cross-coupling reaction, a compound of formula 2-1 may be coupled with compounds of formula 1-6 under reaction conditions known to those skilled in the art. Typical compounds of formula 1-6 used in this reaction include boronic acid (so called Suzuki reaction), zinc halide (so called Negishi reaction), and tin (IV) derivatives (so called Stille reaction) and the like (for examples refer to Tetrahedron, Vol. 54, pp. 263-303, 1998; S. P. Stanforth). A suitable leaving group L' includes halogen, such as chloro, bromo or iodo, preferably iodo, or trifluorosulfonyloxy (CF₃SO₃-). Procedures typically employed are analogous to those described herein before in route 2 (Scheme 1).

[0088] A compound of formula 2-1 is readily prepared from a compound of formula 1-5 and a compound of formula 1-4 according to analogous procedures illustrated in Scheme 1 described herein before.

[0089] In another embodiment, compounds of formula I may be prepared as illustrated in Scheme 3.

SCHEME 3

30 Thus, a compound of formula I may also be prepared by a cross-coupling reaction of a compound of formula 3-1, wherein M is a boronic acid (e.g., -B(OH)_2), a zinc halide (e.g., -ZnCl) or a tin (IV) (e.g., -Sn(n-Bu)_3) derivative, with a compound of formula 3-2, wherein L' is a suitable leaving group, such as chloro, bromo or iodo, preferably iodo, or trifluorosulfonyloxy (CF_3SO_3^-). In the cross-coupling reaction, a compound of formula 3-1 may be coupled with compounds of formula 3-2 under reaction conditions known to those skilled in the art. Compounds of formula 3-1 are readily prepared from compounds of formula 2-1 (Scheme 2) by standard metal-halogen exchange reactions known to those skilled in the art.

35 [0090] Alternatively, compounds of formula I may be prepared as illustrated in Scheme 4.

SCHEME 4

[0091] According to Scheme 4, a pyrazole compound of formula 4-1 may be coupled with a compound of formula 4-2 wherein X is halo, for example, fluoro, bromo or iodo, to yield a compound of formula I. The coupling reaction is usually carried out in the presence of a suitable base such as n-butyllithium (n-BuLi) sodium hydride, potassium carbonate, cesium carbonate, potassium *tert*-butoxide, triethylamine, pyridine, or the like. A suitable reaction inert solvent includes, but is not limited to, tetrahydrofuran (THF), dimethoxyethane (DME), dimethyl sulfoxide (DMSO), dimethylformamide (DMF) or toluene. The reaction is usually carried out at reflux temperature of solvent, however, lower or higher temperatures may be employed. Reaction time is typically for from 10 minutes to several days, usually for from 30 minutes to 15 hours. If desired, a catalyst such as copper (II) oxide or copper (II) bromide may be added to the reaction mixture. Compounds of formula 4-1 may be prepared according to similar procedures illustrated in Scheme 1 described herein before.

[0092] Compounds of formula I may also be prepared according to the procedures illustrated in Scheme 5 through oxidation.

SCHEME 5

Route 1 (Pyrazole-ring Formation and Oxidation):

[0093] According to Route 1, a sulfide compound of formula 5-1 may be oxidized to the compound of formula I using a suitable oxidizing reagent in a reaction inert solvent. This reaction is usually carried out at a temperature from -20°C

to the reflux temperature of the reaction mixture for from about 10 minutes to about 30 hours. Preferably, the reaction may be carried out at a temperature in the range of 0° to 50°C for from about 1 to 20 hours. Suitable oxidizing reagents include mCPBA (m-chloroperoxybenzoic acid), peracetic acid, hydrogen peroxide and oxone. Preferred is mCPBA. Compounds of formula 5-1 may be prepared according to the procedures of Scheme 1 except that a sulfide hydrazine compound of formula 5-2 is used instead of a sulfonyl hydrazine compound of formula 1-4.

Route 2 (Oxidation and R¹-moiety Introduction):

[0094] According to Route 2, compounds of formula 5-4 may be oxidized to compounds of formula 5-5 (2-1) and then converted to compounds of formula I by introducing R¹ group. The oxidation of compounds of formula 5-4 may be carried out according to the similar procedures as illustrated in Route 1 (Scheme 5). Compounds of formula 5-5 (2-1) may be converted to compounds of formula I by coupling reaction with a desired coupling reagent comprising R¹ group according to procedures known to those skilled in the art or similar procedures as illustrated in Scheme 1 and the discussed herein before.

SCHEME 6

Scheme 6 illustrates another preparation methods of compounds of formula I (Heterocycles, 1990, 31, 1041).

SCHEME 7

Referring to Scheme 7, a compound of formula I may also be prepared by a coupling reaction of compound of formula 7-1 and a compound of formula 7-2 under similar conditions illustrated in Scheme 1 or 2.

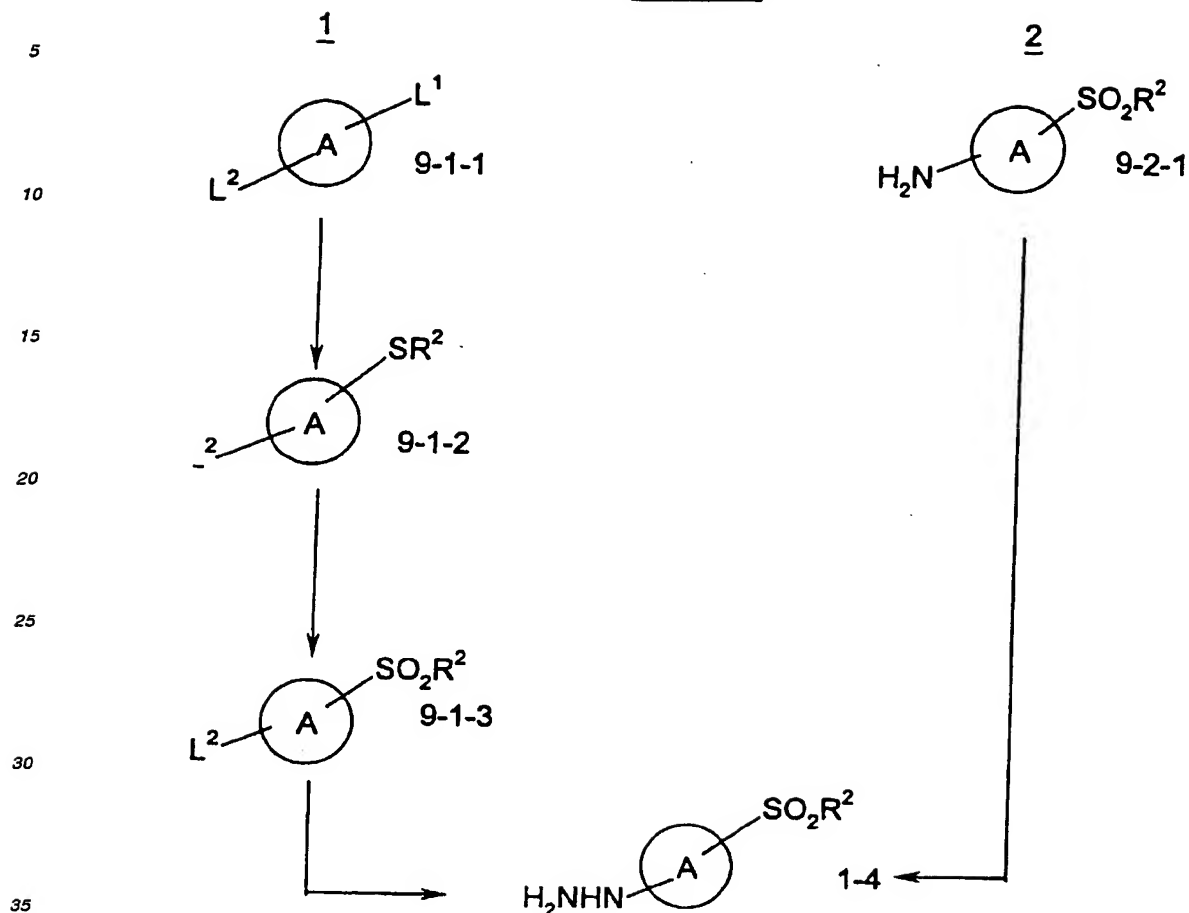

SCHEME 8

Formation of Hydrazine Compounds of Formula 4-1:

40 [0095] Scheme 9 illustrates preparation methods of hydrazine compounds formula 4-1 which can be used in the preparation process illustrated in Scheme 1.

SCHEME 9

Route 1 (Thioalkylation and Oxidation):

[0096] As illustrated in Route 1, compounds of formula 1-4 can be prepared by subjecting a compound of the formula 9-1-1 wherein L^1 and L^2 are leaving groups to thioalkylation, oxidation and reaction with hydrazine or anhydrous hydrazine. Suitable leaving groups of the compounds used in this reaction are halo. In this process, compounds of the formula 1-4 are prepared from compounds of the formula 9-1-3 by reaction with hydrazine or anhydrous hydrazine in the presence of a polar solvent. Suitable solvents used in this reaction include alcohol, such as ethanol, methanol, propanol or butanol; dimethyl sulfoxide (DMSO), N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMA) or N-methyl-2-pyrrolidinone (NMP), preferably an alcohol, most preferably ethanol. This reaction is generally carried out at a temperature from about 0°C to about 140°C, preferably at about the reflux temperature of the polar solvent. Preferably the product is isolated as a salt, such as a hydrochloride salt. The reaction time ranges from about 1 hour to about 1 day. The compound of formula 9-1-3 is prepared from a compound of formula 9-1-2 by reaction with an oxidizing reagent in the presence of a solvent. Suitable oxidants include meta-chloroperoxybenzoic acid, hydrogen peroxide, sodium perborate, or Oxone® (Oxone® is preferred). Suitable solvents or solvent mixtures used in this reaction include methanol-water, dioxane-water, tetrahydrofuran-water, methylene chloride, or chloroform, preferably methanol-water. Suitable temperatures for the aforesaid reaction range from about 0°C to about 60°C, preferably the temperature may range from about 20°C to about 25°C (i.e. room temperature). The reaction is complete within about 0.5 hours to about 24 hours, preferably about 16 hours. The compound of the formula 9-1-2 is prepared from a compound of formula 9-1-1 by nucleophilic substitution reaction using a sulfur nucleophilic reagent such as alkylthiol, dialkyl disulfide, sodium alkylsulfinate, sodium thioalkoxide or potassium thioalkoxide, in the presence or absence of a base in a polar solvent. Suitable bases used in this reaction include sodium hydroxide, triethylamine; alkylolithiums such as n-butyllithium, sec-butyllithium, and *tert*-butyllithium; and lithium diisopropylamide, and suitable solvents include ethers such as dimeth-

ylether; alkanols such as methanol, ethanol and *tert*-butanol; a mixture of an alkanol and water; THF; benzene; toluene; xylene; DMF; DMSO; dioxane; and 1,2-dimethoxyethane. This reaction is generally carried out at a temperature from about -78°C to 200°C for from about 1 minute to 3 days.

5 Route 2 (Hydrazine formation):

[0097] Referring to Route 2, compound of the formula 1-4 may be prepared by reaction of a compound of the formula 9-2-1 with a suitable reagent followed by reduction in an inert solvent or by catalytic hydrogenation. Typical reagents used in the first step include sodium nitrite in an aqueous medium (e.g., hydrochloric acid in water); nitrosyl chloride, nitrogen oxides and nitrile ethers. This reaction is typically carried out at about 0°C for from about 1 minute to about 10 hours. Suitable reducing agents used in the subsequent reduction include zinc powder-acetic acid, metal halides such as TiCl_3 or SnCl_2 , sodium-ethanol, sodium-aqueous ammonia, lithium aluminum hydride and the like. Catalytic hydrogenation may be carried out using a catalyst such as palladium on carbon (Pd/C), palladium on barium sulfate (Pd/BaSO₄), platinum on carbon (Pt/C), or tris(triphenylphosphine) rhodium chloride (Wilkinson's catalyst), in an appropriate solvent such as methanol, ethanol, THF, dioxane or ethyl acetate, at a pressure from about 1 to about 5 atmospheres and a temperature from about 10°C to about 60°C. The following conditions are preferred: Pd on carbon, methanol at 25°C and 50 psi of hydrogen gas pressure. This method also provides for introduction of hydrogen isotopes (i.e., deuterium, or tritium) by replacing $^1\text{H}_2$ with $^2\text{H}_2$ or $^3\text{H}_2$ in the above procedure. Compounds of formula 1-4 thus obtained may be isolated as an acid addition salt such as the hydrochloride salt. Compounds of formula 9-1-1 and 9-2-1 are commercially available or can be prepared by methods well known to those of ordinary skill in the art (e.g., F. Walker et al., J. Chem. Soc. 1939, 1948).

[0098] Triazine compounds of formula 1-4 can be prepared according to the methods illustrated in Scheme 10. In Scheme 10, triazine compounds of formula 1-4 are represented as compounds of formula 10-5.

SCHEME 10

Scheme 10 illustrates preparation methods of compounds of formula 10-5 from compounds of formula 10-1 by substitution reaction with triflate to compounds of formula 10-2; reduction to compounds of formula 10-3; oxidation to compounds of formula 10-4; and substitution reaction with hydrazine. Substitution reaction of compounds of formula 10-1 with triflate can be carried out using triflic anhydride in the presence of pyridine. Reduction of compounds of formula 10-2 may be carried out using a suitable reducing reagent such as sodium borohydride or lithium aluminum hydride. Oxidation of compounds of formula 10-3 may be carried out by using mCPBA or Oxone as described in Scheme 5 and its discussion. Reaction with compounds of formula 10-4 and hydrazine can be carried out in an alcoholic solvent.

Compounds of formula 10-5 thus obtained may be subjected to reactions with diketone compounds as illustrated in Scheme 1 using an acid catalyst such as sulfuric acid in 2,2,2-trifluoroethanol under reflux to yield compounds of formula 11. In the process illustrated in Scheme 10, halogen can be also introduced to compounds of formula 10-2 instead of triflate under known conditions such as chlorination using phosphoryl oxychloride. Compounds of formula 10-1 may be prepared by known procedures described in literature such as *J. Org. Chem.*, Vol. 63, p. 6329, 1998.

[0099] Scheme 11 illustrates preparation methods for synthesizing compounds of formula 11-3, which can be subjected to reactions illustrated in Scheme 9.

SCHEME 11

Referring to Scheme 11, a dicarbonyl compound of formula 11-1, wherein X is NH (i.e., pyrimidine compounds) or CH (i.e., pyridine compounds) and L² is a leaving group, may be subjected to substitution reaction to introduce L¹ to give the compound of formula 11-2 followed by reduction to give the compound of formula 11-3. Typical leaving groups L¹ and L² are halo, which can be introduced by halogenation according to methods known for those skilled in the art. For example, chlorination of a compound of formula 11-1 can be carried out using a chlorinating reagent such as an excess amount of phosphoryl chloride in the presence or absence of a base such as *N,N*-diethylaniline. This reaction can typically be carried out under reflux for from about 30 minutes to about 10 hours. The subsequent reduction of compounds of formula 11-2 may be carried out using a reducing reagent such as a metal catalyst in the presence of a base in a reaction inert solvent according to known methods in the art. For example, this reaction can typically be carried out using zinc powder in the presence of ammonia in a reaction inert solvent such as benzene at about room temperature for from about 1 hour to about 1 day. Then, compounds of formula 11-3 thus obtained can be subjected to the reactions illustrated in Scheme 9.

[0100] Scheme 12 illustrates the other hydrazine preparation methods.

SCHEME 12

The starting materials in the aforementioned general syntheses may be obtained by conventional methods known to those skilled in the art. The preparation of such starting materials is described within the accompanying non-limiting examples which are provided for the purpose of illustration only. Alternatively, requisite starting materials may be obtained by analogous procedures, or modifications thereof, to those described hereinafter.

[0101] In each reaction described above, unless indicated otherwise, the reaction pressure is not critical. Generally, the reactions will be conducted at a pressure of about one to about three atmospheres, preferably at ambient pressure (about one atmosphere).

[0102] The starting materials in the aforementioned general syntheses may be obtained by conventional methods known to those skilled in the art. The preparation of such starting materials is described within the accompanying non-limiting examples which are provided for the purpose of illustration only. Alternatively, requisite starting materials may be obtained by analogous procedures, or modifications thereof, to those described hereinafter.

[0103] The products which are addressed in the aforementioned general syntheses and illustrated in the experimental examples described herein after may be isolated by standard methods and purification can be achieved by conventional means known to those skilled in the art, such as distillation, crystallization or chromatography techniques.

[0104] Certain compounds described herein contain one or more asymmetric centers and are capable of existing in various stereoisomeric forms. The present invention contemplates all such possible stereoisomers as well as their racemic and resolved, enantiomerically pure forms and pharmaceutically acceptable salts thereof.

[0105] In addition, when the compounds of this invention form hydrates or solvates they are also within the scope of this invention.

[0106] The compounds of the formula I which are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to initially isolate a compound of the formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent, and subsequently convert the free base to a pharmaceutically acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent such as methanol or ethanol. Upon careful vaporation of the solvent, the desired solid salt is obtained.

[0107] The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate or bisulfate, phosphate or acid phosphate, acetate, lactate, citrate or acid citrate, tartrate or bitartrate, succinate, maleate, fumarate, gluconate, saccharate, benzoate, methanesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)] salts.

[0108] Those compounds of the formula I which are also acidic in nature, e.g., where R^3 includes a COOH or tetrazole moiety, are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline-earth metal salts and particularly, the sodium and potassium salts. These salts are all prepared by conventional techniques. The chemical bases which are used as reagents to prepare the pharmaceutically acceptable base salts of this invention are those which form non-toxic base salts with the herein described acidic compounds of formula I. These non-toxic base salts include those derived from such pharmacologically acceptable cations as sodium, potassium, calcium and magnesium, etc. These salts can easily be prepared by treating the corresponding acidic compounds with an aqueous solution containing the desired pharmacologically acceptable cations, and then evaporating the resulting solution to dryness, preferably under reduced pressure. Alternatively, they may also be prepared by mixing lower alkanolic solutions of the acidic compounds and the desired alkali metal alkoxide together, and then evaporating the resulting solution to dryness in the same manner as before. In either case, stoichiometric quantities of reagents are preferably employed in order to ensure completeness of reaction and maximum product yields.

[0109] Also included within the scope of this invention are bioprecursors (also called prodrugs) of the compounds of the formula I. A bioprecursor of a compound of the formula I is a chemical derivative thereof which is readily converted back into the parent compound of the formula I in biological systems. In particular, a bioprecursor of a compound of the formula I is converted back to the parent compound of the formula I after the bioprecursor has been administered to, and absorbed by, a mammalian subject, e.g., a human subject.

[0110] The subject invention also includes isotopically-labelled compounds, which are identical to those recited in formula I, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl , respectively. Compounds of the present invention, prodrugs thereof, and pharmaceutically acceptable salts of said compounds or of said prodrugs which contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically-labelled compounds of the present invention, for example those into which radioactive isotopes such as ^3H and ^{14}C are incorporated, are useful in drug and/or substrate tissue distribution assay. Tritiated, i.e., ^3H , and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of presentation and detectability. Further, substitution with heavier isotopes such as deuterium, i.e., ^2H , can afford therapeutic advantage resulting from greater metabolic stability, for example increased *in vivo* half-life or reduced dosage requirement and, hence, may be preferred in some circumstances. Isotopically labelled compounds of formula I of this invention and prodrugs thereof can generally be prepared by carrying out the procedure disclosed in above-disclosed Schemes and/or Examples and Preparations below, by submitting a readily available isotopically labelled reagent for a non-isotopically labeled reagent.

[0111] The compounds of the formula I of this invention can be administered via either the oral, parenteral or topical routes to mammals. In general, these compounds are most desirably administered to humans in doses ranging from 0.01 mg to 100 mg per kg of body weight per day, although variations will necessarily occur depending upon the weight, sex and condition of the subject being treated, the disease state being treated and the particular route of administration chosen. However, a dosage level that is in the range of from 0.1 mg to 10 mg per kg of body weight per day, single or divided dosage is most desirably employed in humans for the treatment of abovementioned diseases.

[0112] These compounds are most desirably administered to said non-human mammals, e.g. dogs, cats, horses or livestock in an amount, expressed as mg per kg of body weight of said member per day, ranging from about 0.01 mg/kg to about 20.0 mg/kg/day, preferably from about 0.1 mg/kg to about 12.0 mg/kg/day, more preferably from about 0.5 mg/kg to about 10.0 mg/kg/day, and most preferably from about 0.5 mg/kg to about 8.0 mg/kg/day.

[0113] The compounds of the present invention may be administered alone or in combination with pharmaceutically acceptable carriers or diluents by either of the above routes previously indicated, and such administration can be carried out in single or multiple doses. More particularly, the novel therapeutic agents of the invention can be administered in a wide variety of different dosage forms, i.e., they may be combined with various pharmaceutically acceptable inert carriers in the form of tablets, capsules, lozenges, troches, hard candies, powders, sprays, creams, salves, suppositories, jellies, gels, pastes, lotions, ointments, aqueous suspensions, injectable solutions, elixirs, syrups, and the like. Such carriers include solid diluents or fillers, sterile aqueous media and various nontoxic organic solvents, etc. Moreover, oral pharmaceutical compositions can be suitably sweetened and/or flavored. In general, the therapeutically effective compounds of this invention are present in such dosage forms at concentration levels ranging from 5% to 70% by weight, preferably 10% to 50% by weight.

[0114] For oral administration, tablets containing various excipients such as microcrystalline cellulose, sodium citrate, calcium carbonate, dipotassium phosphate and glycine may be employed along with various disintegrants such as starch and preferably corn, potato or tapioca starch, alginic acid and certain complex silicates, together with granulation binders like polyvinylpyrrolidone, sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often very useful for tabletting purposes. Solid compositions of a similar type may also be employed as fillers in gelatine capsules; preferred materials in this connection also include lactose or milk sugar as well as high molecular weight polyethylene glycols. When aqueous suspensions and/or elixirs are desired for oral administration, the active ingredient may be combined with various sweetening or flavoring agents, coloring matter or dyes, and, if so desired, emulsifying and/or suspending agents as well, together with such diluents as water, ethanol, propylene glycol, glycerin and various combinations thereof.

[0115] For parenteral administration, solutions of a compound of the present invention in either sesame or peanut oil or in aqueous propylene glycol may be employed. The aqueous solutions should be suitably buffered (preferably pH > 8) if necessary and the liquid diluent first rendered isotonic. These aqueous solutions are suitable for intravenous injection purposes. The oily solutions are suitable for intra-articular, intra-muscular and subcutaneous injection purposes. The preparation of all these solutions under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art. Additionally, it is also possible to administer the compounds of the present invention topically when treating inflammatory conditions of the skin and this may preferably be done by way of creams, jellies, gels, pastes, ointments and the like, in accordance with standard pharmaceutical practice.

[0116] The compounds of formula I may also be administered in the form of suppositories for rectal or vaginal administration of the active ingredient. These compositions can be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at room temperature (for example, 10°C to 32°C) but liquid at the rectal temperature and will melt in the rectum or vagina to release the active ingredient. Such materials are polyethylene glycols, cocoa butter, suppository and wax.

[0117] For buccal administration, the composition may take the form of tablets or lozenges formulated in conventional manner.

Methods of Assessing Biological Activities:

[0136] Activities of the compounds of the formula I of the present invention may be demonstrated by the following assays.

In vitro assays:

Human cell based COX-1 assay:

[0137] Human peripheral blood obtained from health volunteers is diluted to 1/10 volume with 3.8% sodium citrate solution. The platelet-rich plasma immediately obtained is washed with 0.14M sodium chloride solution containing 12mM Tris-HCl (pH 7.4) and 1.2mM EDTA. Platelets are then washed with platelet buffer (Hanks buffer (calcium free) containing 0.2% BSA and 20mM Hepes buffer). Finally, the human washed platelets (HWP) are suspended in platelet buffer at the concentration of 2.85×10^8 cells/ml and stored at room temperature until used. The HWP suspension (70 μ l aliquots, final 2.0×10^7 cells/ml) is placed in a 96-well U bottom plate and 10 μ l aliquots of 12.6mM CaCl_2 is added. Platelets are incubated with A23187 (final 10 μ M, Sigma) with a test compound (0.1 - 100 μ M) dissolved in DMSO (final concentration; less than 0.01%) at 37°C for 15 minutes. The reaction is quenched by adding EDTA (final 7.7mM), and TxB_2 in the supernatant quantitated by using a radioimmunoassay kit (supplied by Amersham) according to the manufacture's procedure.

Human Cell Based COX-2 Assay:

[0138] The human cell based COX-2 assay is carried as previously reported by Moore *et al.*, *Inflam. Res.*, Vol. 45, pp. 54- , 1996. Confluent human umbilical vein endothelial cells (HUVECs, Morinaga) in a 96-well U bottom plate are washed with 100 μ l of RPMI1640 containing 2% FCS and incubation with hIL-1 α (final concentration 300U/ml, R & D Systems) at 37°C for 24 hours. After washing, the activated HUVECs are stimulated with A23187 (final concentration 30 μ M) in Hanks buffer containing 0.2% BSA, 20mM Hepes and a test compound (0.1nM - 100 μ M) dissolved in DMSSO (final concentration; less than 0.01%) 37°C for 15 minutes. 6-Keto-PGF $_{1\alpha}$, stable metabolite of PGI $_2$, in the supernatant is quantitated after adequate dilution by using a radioimmunoassay kit (supplied by Amersham) according to the manufacture's procedures.

Canine In vitro assays

[0139] The following canine cell based COX 1 and COX-2 assays have been reported in Ricketts *et al.*, Evaluation of Selective Inhibition of Canine Cyclooxygenase 1 and 2 by Carprofen and Other Nonsteroidal Anti-inflammatory Drugs, American Journal of Veterinary Research, 59(11), 1441-1446.

Protocol for Evaluation of Canine COX-1 Activity

[0140] Test drug compounds were solubilized and diluted the day before the assay was to be conducted with 0.1 mL of DMSO / 9.9 mL of Hank's balanced salts solution (HBSS), and stored overnight at 4° C. On the day that the assay was carried out, citrated blood was drawn from a donor dog, centrifuged at 190 x g for 25 minutes at room temperature, and the resulting platelet-rich plasma was then transferred to a new tube for further procedures. The platelets were washed by centrifuging at 1500 x g for 10 minutes at room temperature. The platelets were washed with platelet buffer comprising Hank's buffer (Ca free) with 0.2% bovine serum albumin (BSA) and 20 mM HEPES. The platelet samples were then adjusted to 1.5×10^7 / mL, after which 50 μ l of calcium ionophore (A23187) together with a calcium chloride solution were added to 50 μ l of test drug compound dilution in plates to produce final concentrations of 1.7 μ M A23187 and 1.26 mM Ca. Then, 100 μ l of canine washed platelets were added and the samples were incubated at 37°C for 15 minutes, after which the reaction was stopped by adding 20 μ l of 77 mM EDTA. The plates were then centrifuged at 2000 x g for 10 minutes at 4°C, after which 50 μ l of supernatant was assayed for thromboxane B $_2$ (TXB $_2$) by enzyme-immunoassay (EIA). The pg/mL of TXB $_2$ was calculated from the standard line included on each plate, from which it was possible to calculate the percent inhibition of COX-1 and the IC $_{50}$ values for the test drug compounds.

Protocol for Evaluation of Canine COX-2 Activity

[0141] A canine histiocytoma (macrophage-like) cell line from the American Type Culture Collection designated as DH82, was used in setting up the protocol for evaluating the COX-2 inhibition activity of various test drug compounds. There was added to flasks of these cells 10 pg/mL of LPS, after which the flask cultures were incubated overnight. The same test drug compound dilutions as described above for the COX-1 protocol were used for the COX-2 assay and were prepared the day before the assay was carried out. The cells were harvested from the culture flasks by scraping, and were then washed with minimal Eagle's media (MEM) combined with 1% fetal bovine serum, centrifuged at 1500 rpm for 2 minutes, and adjusted to a concentration of 3.2×10^5 cells/mL. To 50 μ L of test drug dilution there was added 50 μ L of arachidonic acid in MEM to give a 10 pM final concentration, and there was added as well 100 μ L of cell suspension to give a final concentration of 1.6×10^5 cells/mL. The test sample suspensions were incubated for 1 hr and then centrifuged at 1000 rpm for 10 minutes at 4° C, after which 50 μ L aliquots of each test drug sample were delivered to EIA plates. The EIA was performed for prostaglandin E₂ (PGE₂), and the pg/mL concentration of PGE₂ was calculated from the standard line included on each plate. From this data it was possible to calculate the percent inhibition of COX-2 and the IC₅₀ values for the test drug compounds. Repeated investigations of COX-1 and COX-2 inhibition were conducted over the course of several months. The results are averaged, and a single COX-1 : COX-2 ratio is calculated.

[0142] Whole blood assays for COX-1 and COX-2 are known in the art such as the methods described in C. Brideau, et al., A Human Whole Blood Assay for Clinical Evaluation of Biochemical Efficacy of Cyclooxygenase Inhibitors, Inflammation Research, 45, 68-74, (1996). These methods may be applied with feline, canine or human blood as needed.

In vivo Assays:

Canine whole blood ex vivo determinations of COX-1 and COX-2 activity inhibition

[0143] The *in vivo* inhibitory potency of a test compound against COX-1 and COX-2 activity may be evaluated using an *ex vivo* procedure on canine whole blood. Three dogs were dosed with 5 mg/kg of the test compound administered by oral gavage in 0.5% methylcellulose vehicle and three dogs were untreated. A zero-hour blood sample was collected from all dogs in the study prior to dosing, followed by 2- and 8-hour post-dose blood sample collections. Test tubes were prepared containing 2pL of either (A) calcium ionophore A23187 giving a 50 μ M final concentration, which stimulates the production of thromboxane B₂ (TXB₂) for COX-1 activity determination; or of (B) lipopolysaccharide (LPS) to give a 10 pg/mL final concentration, which stimulates the production of prostaglandin E₂ (PGE₂) for COX-2 activity determination. Test tubes with unstimulated vehicle were used as controls. A 500 μ L sample of blood was added to each of the above-described test tubes, after which they were incubated at 37°C for one hr in the case of the calcium ionophore-containing test tubes, and overnight in the case of the LPS-containing test tubes. After incubation, 10 μ L of EDTA was added to give a final concentration of 0.3%, in order to prevent coagulation of the plasma which sometimes occurs after thawing frozen plasma samples. The incubated samples were centrifuged at 4°C and the resulting plasma sample of ~200 μ L was collected and stored at -20°C in polypropylene 96-well plates. In order to determine endpoints for this study, enzyme immunoassay (EIA) kits available from Cayman were used to measure production of TXB₂ and PGE₂, utilizing the principle of competitive binding of tracer to antibody and endpoint determination by colorimetry. Plasma samples were diluted to approximate the range of standard amounts which would be supplied in a diagnostic or research tools kit, i.e., 1/500 for TXB₂ and 1/750 for PGE₂.

[0144] The data set out in Table 2 below show how the percent inhibition of COX-1 and COX-2 activity is calculated based on their zero hour values. The data is expressed as treatment group averages in pg/mL of TXB₂ and PGE₂ produced per sample. Plasma dilution was not factored in said data values.

[0145] The data in Table 2 show that, in this illustration, at the 5 mg/kg dose there was significant COX-2 inhibition at both timepoints. The data in Table 2 also show that at the 5 mg/kg dose there was no significant inhibition of COX-1 activity at the timepoints involved. Accordingly, the data in Table 2 clearly demonstrates that at the 5 mg/kg dosage concentration this compound possesses good COX-2 selectivity.

[0146] COX inhibition is observed when the measured percent inhibition is greater than that measured for untreated controls. The percent inhibition in the above table is calculated in a straightforward manner in accordance with the following equation:

$$\% \text{ Inhibition (2-hour)} = \frac{(\text{PGE}_2 \text{ at } t = 0) - (\text{PGE}_2 \text{ at } t = 2)}{(\text{PGE}_2 \text{ at } t = 0)}$$

Carrageenan induced foot edema in rats

[0147] Male Sprague-Dawley rats (5 weeks old, Charles River Japan) are fasted overnight. A line is drawn using a marker above the ankle on the right hind paw and the paw volume (VO) is measured by water displacement using a plethysmometer (Murromachi). Animals are given orally either vehicle (0.1% methyl cellulose or 5% Tween 80) or a test compound (2.5ml per 100g body weight). One hour later, the animals are then injected intradermally with \square -carrageenan (0.1ml of 1% w/v suspension in saline, Zushikagaku) into right hind paw (Winter *et al.*, *Proc. Soc. Exp. Biol. Med.*, Vol. 111, p. 544- , 1962; Lombardino *et al.*, *Arzneim. Forsch.*, Vol. 25, p. 1629- , 1975) and three hours later, the paw volume (V3) is measured and the increase in volume (V3-V0) calculated. Since maximum inhibition attainable with classical NSAIDs is 60 - 70%, ED₃₀ values are calculated.

Gastric ulceration in rats

[0148] The gastric ulcerogenicity of a test compound is assessed by a modification of the conventional method (Ezer *et al.*, *J. Pharm. Pharmacol.*, Vol. 28, p. 655- , 1976; Cashin *et al.*, *J. Pharm. Pharmacol.*, Vol. 29, pp. 330-336, 1977). Male Sprague-Dawley rats (5 weeks old, Charles River Japan), fasted overnight, were given orally either vehicle (0.1% methyl cellulose or 5% Tween 80) or a test compound (1ml per 100g body weight). Six hours after, the animals are sacrificed by cervical dislocation. The stomachs are removed, inflated with 1% formalin solution (10ml), opened by cutting along the greater curvature. From the number of rats that show at least gastric ulcer or haemorrhaging erosion (including ecchymosis), the incidence ulceration is calculated. Animals do not have access to either food or water during the experiment.

Data Analysis:

[0149] Statistical program packages, SYSTANT (SYSTANT, INC.) and StatView (Abacus Concepts, Inc.) for Macintosh are used. Difference between test compound treated groups and control group are tested for using ANOVA. The IC₅₀ (ED₃₀) values are calculated from the equation for the log-linear regression of concentration (dose) versus percent inhibition.

[0150] Most compounds prepared in the Working Examples as described hereinafter were tested by at least one of the methods described above, and showed IC₅₀ values of 0.001 μ M to 3 μ M with respect to inhibition of COX-2 in either the canine or human assays.
